There are four different serotypes of dengue fever virus, which are not cross-protective, so inhabitants of areas of the world where these viruses are endemic may experience infection with more than one serotype in their lifetime. A positive PCR or persistence of antibody beyond 18 months is indicative of vertical transmission. Incubation period is 2–21 days. There is no evidence that MMR vaccine is associated with autism and it is regarded as safe. Treatment No No Person-to-person spread? This is because HBV mutants exist, that either do not express HBe antigen core mutants or that produce altered HBe antigen pre-core mutants and these patients despite being anti-HBe positive have a high level of viral DNA in their blood and are highly infectious. Dengue shock syndrome has a high mortality. Home Contact Us Help Free delivery worldwide. The paralysis is usually accompanied by a prodrome of fever and other signs of a non-specific viral illness see .
