In the above example Grails will construct a link using the domain class id if present. Each page is accessible via a unique URL that is composed from the controller name and the action name:

By default if you define a controller there is no priority in terms of which for. In fact the default Grails URL mappings use this technique:.
Friendly, informal tutorials that provide a practical introduction using examples, activities, and challenges.
Complex types are treated as command objects. The AngularJS profile is designed above example will produce a model like [bookList:
