Ice Flows - A game about ice flows in the Antarctic

An ice floe or ice float is a large pack of floating ice often defined as a flat piece at least 20 m across at its widest point, and up to more than 10 km across.

IceFlow - University of Copenhagen

Ice flow measurements were carried out in the lateth century on Hochjoch Ferner and Hintereis Ferner. Today annual ice flow velocity is measured along.

Ice sheets grow on land and flow towards their coastal margins. Science The game is called Ice Flows - because it does! Ice Flows is based on science - but some elements are fiction in order to make the Ice Flow fun to play. Fiction Sea ice is not represented in the game, though it plays an important role. We can see the layers of ice building up in data from radar measurements. Sea ice is a different entity to glacial ice, being formed by frozen Ice Flow water. In reality, an ice sheet is a single entity, rather than a set of blocks. The game is based on a simple ice sheet model which represents the way in which Ice flows slowly, from a few metres per year, to several metres per day.
